

Database State of Health Check

 Including a Database Health Scorecard

Gain Peace of Mind with A Database State of Health Check

Aspect's **Database State of Health Check** is an in-depth, comprehensive audit of databases across your environment. Knowledge is power, and proactively determining what is causing problems, what is about to cause problems, and what is functioning at an optimal level puts you in the driver's seat. Let us give you a clear picture of your database health, and a smart roadmap for future improvements.

Comprehensive Audit Checks

Aspect's State of Health check includes over 75+ audit checks across 5 categories:

Backup and Recovery: checks assesses whether backup type and frequency meet best practices and your RTO/RPO expectations.

Performance: checks assess whether CPU, memory, disk space, allocation & consumption fall within acceptable ranges, and whether indexing opportunities exist for performance improvement.

Security: gathers role memberships and permissions for review, and identify settings that fall outside of best practices.

Configuration: gathers configuration settings that fall outside of best practices for review and remediation.

Jobs & Notifications: gathers alerts, job ownership & status info for review, and email & notification configuration for assessment.

Why Perform a Database State of Health Check

Peace of Mind:

An State of Health Check gives your organization a quick but comprehensive snapshot of your environment, so you can proactively identify and remediate any hidden issues.

A Fresh Perspective:

Since there are multiple ways to fix problems, a fresh perspective can bring new information to the table for remediating stubborn issues.

Organizational Change:

Experienced a key departure, a new addition, or a changing of the guard in management? Aspect's Database State of Health Check quickly collects & provides cross environment information to fully inform new staff and help with the transition.

Deliverables Designed to Help You Prioritize and Plan for the Future

Aspect's State of Health Check deliverables include information at both the summary level for Executives, and the detail level for technical DBA review.

Database Health Scorecard: An overall Scorecard gives stakeholders a quick visual into database health for each server/instance included in the audit. An executive summary summarizes all findings for both management-level and technical reviewers.

Detailed Results Organized by Severity: Detailed results with recommendations for remediation are organized by severity (Critical, Medium, and Longer-term issues), giving technical stakeholders a better idea of the scope of planning needed to stabilize & optimize the environment going forward.
